Dental Veneers

Ever wondered how veneers can change your smile to give you the perfect teeth you always desired? Dental veneers are thin shells of tooth-colored, translucent porcelain or composite resin, custom made to fit over the front surface of your teeth to improve their color, shape and overall appearance. The placement of veneers can dramatically improve your smile and give you those perfect, pearly whites you have always dreamed of!

Veneers can cover a variety of dental problems involving:

- Spaces between the teeth
- Poorly shaped or crooked teeth
- Broken or chipped teeth
- Permanently externally stained and/or internally stained teeth
- Unsightly or stained fillings

Composite resin veneers:

- Placed on the tooth and cured inside the clinic
- Normally last up to 6 years
- Require regular polishing

Porcelain veneers:

- Made of very thin slices of porcelain that are glazed with a very life-like appearance
- They are more stain-resistant than composite veneers
- Cemented to the outside surface of the teeth
- Teeth may need to be slightly reduced or shaved down; otherwise the veneers can be too prominent or bulgy

For that killer smile, call us now to book your free smile consult!
